

## DPX30-xxWSxx DC-DC Converter Module

10 ~ 40VDC, 18 ~ 75VDC input; 3.3 to 28VDC Single Output  
30 Watts Output Power

### FEATURES

- NO MINIMUM LOAD REQUIRED
- 1600VDC INPUT TO OUTPUT ISOLATION
- SCREW TERMINALS FOR INPUT AND OUTPUT CONNECTIONS
- RELIABLE SNAP-ON FOR DIN RAIL TS-35/7.5 OR TS-35/15
- CASE PROTECTION MEETS IP20(IEC60529)
- INPUT FUSE PROTECTION
- INPUT REVERSE POLARITY PROTECTION
- INPUT IN-RUSH CURRENT LIMIT CIRCUIT
- OUTPUT DC-OK INDICATOR
- 4:1 WIDE INPUT VOLTAGE RANGE
- FIXED SWITCHING FREQUENCY
- INPUT UNDER-VOLTAGE PROTECTION
- OUTPUT OVER-VOLTAGE PROTECTION
- OVER-CURRENT PROTECTION
- OUTPUT SHORT CIRCUIT PROTECTION
- MEETS EN55022 CLASS B
- COMPLIANT TO RoHS II & REACH

CE MARKED

SAFETY MEETS: UL60950-1  
EN60950-1  
IEC60950-1

### APPLICATIONS

- COMMUNICATION SYSTEMS
- INDUSTRY CONTROL SYSTEMS
- FACTORY AUTOMATIC EQUIPMENT
- SEMICONDUCTOR EQUIPMENT

### OPTIONS

- REMOTE ON/OFF

### GENERAL DESCRIPTION

The DPX30-xxWSxx series was designed to offer easy installation with snap-on type mounting to a DIN-rail. Internal protection circuits such as input voltage reversal and in-rush current limit protection, as well as output short-circuit, over-current protection and over-voltage protection. A green LED at the front displays the status of the output.

### Input Source Impedance

The power module should be connected to a low impedance input source. Highly inductive source impedance can affect the stability of the power module. The input reflected-ripple current measurement configuration is shown below:

#### Input reflected-ripple current measurement setup

### Output Over Current Protection

When excessive output currents occur in the system, circuit protection is required on all power supplies. Normally, overload current is maintained at approximately 150 percent of rated current for DPX30-xxWSxx series. Hiccup-mode is a method of operation in a power supply whose purpose is to protect the power supply from being damaged during an over-current fault condition. It also enables the power supply to restart when the fault is removed. There are other ways of protecting the power supply when it is over-loaded, such as the maximum current limiting or current fold-back methods.

One of the problems resulting from over current is that excessive heat may be generated in power devices; especially MOSFET and Schottky diodes and the temperature of those devices may exceed their specified limits. A protection mechanism has to be used to prevent those power devices from being damaged.

The operation of hiccup is as follows. When the current sense circuit sees an over-current event, the controller shuts off the power supply for a given time and then tries to start up the power supply again. If the over-load condition has been removed, the power supply will start up and operate normally; otherwise, the controller will see another over-current event and shut off the power supply again, repeating the previous cycle. Hiccup operation has none of the drawbacks of the other two protection methods, although its circuit is more complicated because it requires a timing circuit. The excess heat due to overload lasts for only a short duration in the hiccup cycle, hence the junction temperature of the power devices is much lower.

The hiccup operation can be done in various ways. For example, one can start hiccup operation any time an over-current event is detected; or prohibit hiccup during a designated start-up interval (usually a few milliseconds). The reason for the latter operation is that during start-up, the power supply needs to provide extra current to charge up the output capacitor. Thus the current demand during start-up is usually larger than during normal operation and it is easier for an over-current event to occur. If the power supply starts to hiccup once there is an over-current, it might never start up successfully. Hiccup mode protection will give the best protection for a power supply against over current situations, since it will limit the average current to the load at a low level, so reducing power dissipation and case temperature in the power devices.

### Output Short Circuit Protection

Continuous and auto-recovery mode.

During short circuit, converter still shut down. The average current during this condition will be very low and the device can be safety in this condition.

### Output Over Voltage Protection

The output over-voltage protection consists of output Zener diode that monitors the voltage on the output terminals. If the voltage on the output terminals exceeds the over-voltage protection threshold, then the Zener diode clamps the output voltage.

### Remote On/off Control

The Ctrl Pin is used to turn the power module on and off. The user must use a switch to control the logic voltage (high or low) level of the pin referenced to  $-V_{in}$ . The switch can be an open collector transistor, FET, or Photo-Coupler. The switch must be capable of sinking up to 1 mA at low-level logic voltage. A High-level logic of the Ctrl pin signal should be limited to a maximum voltage of 12V and a maximum current of 0.5 mA.

Isolated-Closure Remote ON/OFF

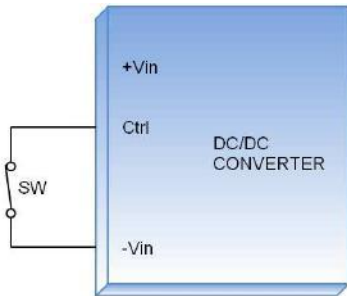

Level Control Using TTL Output

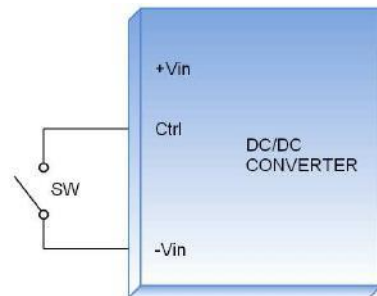

Level Control Using Line Voltage

**There are two remote control options available, positive logic and negative logic.**

a. The positive logic structure turns on the DC/DC module when the Ctrl pin is at a high- logic level and turns the module off by using a low-logic level.

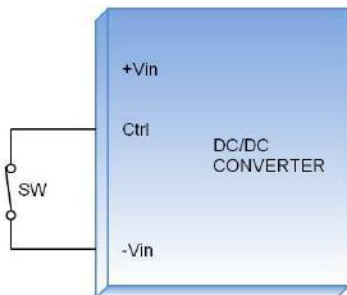

When DPX30-xxWSxx-P module is turned off using a Low-logic level

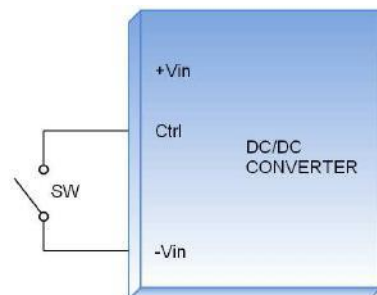

When DPX30-xxWSxx-P module is turned on using a High- logic level

b. The negative logic structure turns on the DC/DC module when the Ctrl pin is at a low- logic level and turns the module off using a high-logic level.

When DPX30-xxWSxx-N module is turned on using a Low-logic level

When DPX30-xxWSxx-N module is turned off using a High-logic level

### EMS Considerations

The DPX30-xxWSxx series can meet Fast Transient EN61000-4-4 and Surge EN61000-4-5 performance criteria A. Please see the following schematic below.

### MTBF and Reliability

The MTBF of DPX30-xxWxx DC/DC converters has been calculated using MIL-HDBK-217F NOTICE2 FULL LOAD, Operating Temperature at 25°C. The resulting figure for MTBF is 8.412×10<sup>5</sup> hours.
